

How to identify an iPhone

New Jersey Regional Computer Forensics Laboratory

You will need a
“tool”...

1

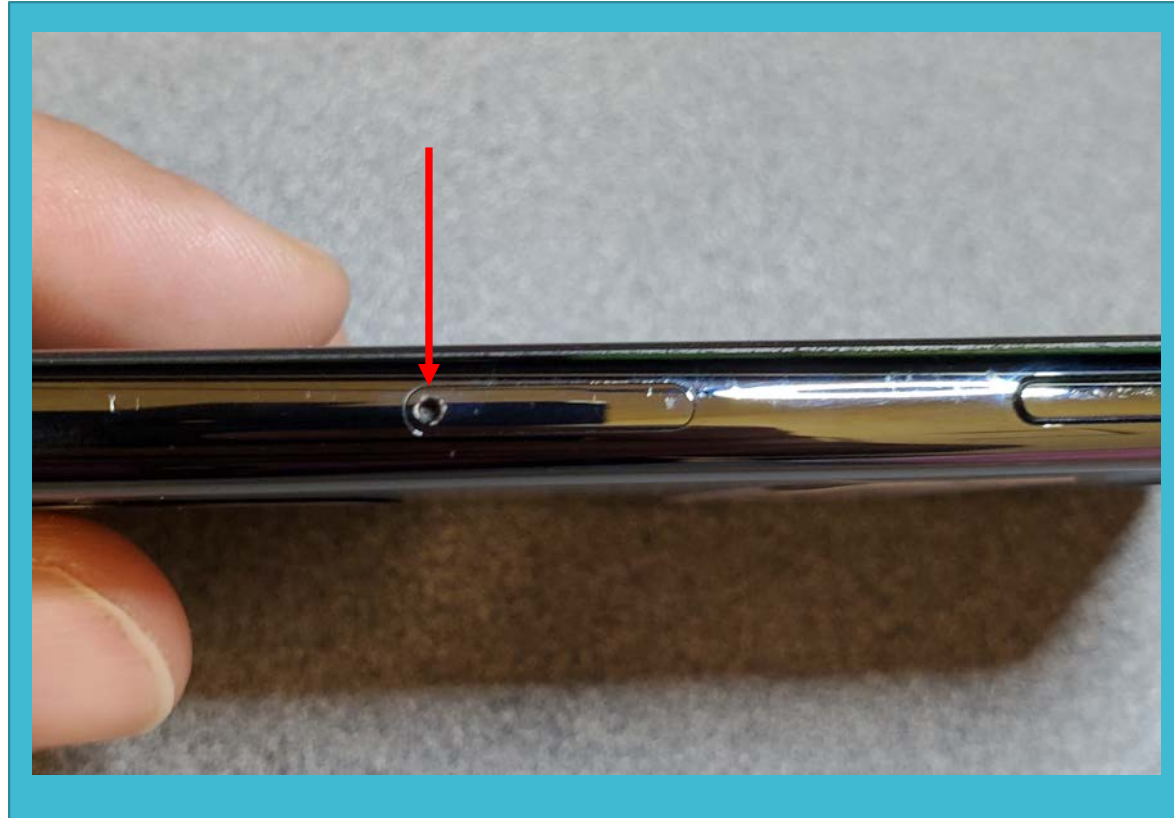

- A SIM remover comes in the box with every modern phone. BUT a skinny paperclip works just fine!

Find the SIM tray on the phone.

2

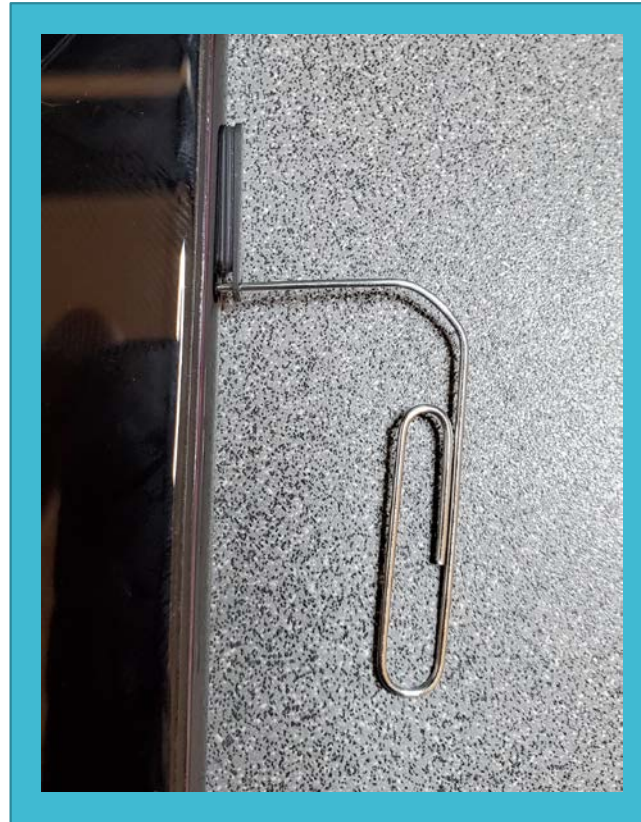

- The slim tray will be a small skinny oval tray with a small hole in it.

Insert the tool
into the SIM
tray hole.

3

- With enough pressure the SIM tray will pop out of the phone enough to be pulled out with your fingers.

Look inside the opening where the tray was seated.

4

- Put the SIM tray and SIM card aside, put the phone on its side, and look inside the hole where the SIM tray was seated. You may have to tilt the phone slightly away from or towards you. Stamped on one side of the opening is "Assembled in China". Stamped on the opposite side will be the model number "A####". A magnifying glass or zoomed photo from another phone may help read the number.

Please send that model number to the lab.

I cannot find
the SIM tray???

Look inside the
charging port!

4a

- iPhone 14 removed the physical SIM, as a result the model number is in the charging port. Look inside the charging port on the bottom of the phone. You may have to tilt the phone slightly away from or towards you. Stamped on one side will be the model number and China "A#### China". A magnifying glass or zoomed photo from another phone may help read the number.

Please send that model number to the lab.
